DETAILED ACTION

1. This action is responsive to communications of application received 03/21/2005.
2. The disposition of the claims is as follows: claims 1 - 9 are pending in the application. Claim 1 is the only independent claim.
3. The group and/or Art Unit location of your application has changed. To aid in the correlation of any papers for this application, all further correspondence should be directed to Group Art Unit 2624 (effective 03/08). Please be sure to use the most current art unit number on all correspondence to help us route your case and respond to you in a timely fashion.

Allowable Subject Matter

4. Claims 1 - 9 are allowed.

The following is an examiner's statement of reasons for allowance:

The closest prior art of Connor, (US 3,920,889), hereinafter Connor, provides for the contrast at the edges of moving objects in a television picture is enhanced by the novel technique of averaging a past and a future video frame, subtracting the averaged frame from the current frame to generate a second derivative video signal and then adding an attenuated version of the second derivative video signal to the current frame to generate a video signal having more clearly defined moving edges. Advantageously, the incoming video signal is first digitalized thus permitting the use of a digital memory as the frame-store.

Next Fisher et al., (US 6,384,414 B1), hereinafter Fisher, provides for the detection of an object by filtering calculations including, but not limited to, weighted moving average filters, order statistic filters such as a median filter, or a combination of moving average and order statistic calculations or filters may be used to condition data, and more particularly, to condition temperature data. With the benefit of this disclosure, those of skill in the art will understand that such filters may be modified to compute various quantities from the data including, but not limited to, mean values, mean squared values, mean cubed values, median values, median squared values, first order derivatives, second order derivatives, higher order derivatives, and/or higher order moments.

However neither Connor, nor Fisher provide for a data calculation unit to calculate moving average data and second derivative data for a plurality of samples made of multivalued data, the plurality of samples being data in a vertical direction and a horizontal direction in reading an inputted image data; a position detection unit to detect first and second positions at which the moving average data and second derivative data have a predetermined relationship based on the moving average data and second derivative data, for each of the plurality of samples; a parallel region determination unit to determine a parallel region based on the first and second positions detected for each of the plurality of samples; an inclination detection unit to determine inclinations of four sides of the inputted image based on the determined parallel region; and an inclination detection unit to correct the inputted image data based on the detected inclinations as claimed in independent claim 1.

Therefore as claimed by the combined elements of independent claim 1, the cited references of prior art lack separately and in combination the elements of said claim.

Claims 2-9 depend from allowable independent claim 1 and therefore are also allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
